Press Release

FOR IMMEDIATE RELEASE — XXXX DD, YYYY

Medical Informatics Engineering launches OSHA Medical Surveillance Quality Framework for EnterpriseHealth and WebChart EHR

Medical Informatics Engineering, Inc. (MIE) today announced general availability of the OSHA Medical Surveillance Quality Framework, a production-ready suite of eCQM-compatible measures and real-time quality dashboards for EnterpriseHealth (occupational health EHR) and WebChart EHR (certified clinical EHR). The framework leverages the CMS eCQM standards stack—HQMF, CQL, and value sets—to define, execute, and report OSHA-aligned surveillance quality measures across patients, providers, locations, and the enterprise.

“With this release, we’re raising the bar for medical surveillance,” said Doug Horner. “By packaging OSHA-aligned measures using the eCQM toolchain and opening the measure definitions, we make quality transparent, measurable, and actionable—while giving the industry a path to consistent reporting and compliance.”

What’s included

- Multi-level quality dashboards: Drill from enterprise to location, provider, and patient to track performance, gaps, and trends in real time.
- OSHA Surveillance Quality Library: NQF-like, open-source measure definitions covering incident rates, exposure follow-up adherence, panel completion, and return-to-work readiness.
- eCQM-native packaging: Each measure ships with HQMF, CQL, ELM, and FHIR ValueSets for drop-in execution within EnterpriseHealth and WebChart EHR analytics.

- Automated patient notifications: Triggered SMS and email reminders when patients fall short of measures, with auditable timelines, response capture, and outcome tracking.
- HRIS-aware cohorts: Link employees to supervisors, shifts, and locations for targeted outreach and escalations to close surveillance gaps.
- Analytics that explain the “why”: FillMeIn visualizes measure performance, cohorts, and drivers; teams export summaries for quality committees and leadership.
- Outreach at scale: DataChaser powers SMS/email/phone campaigns with interview flows and a dashboard of conversation links for real-time campaign monitoring.

How it works

- Define: Measures authored in CQL with clear populations, numerator/denominator logic, exclusions, and measurement periods; value sets bound by OIDs.
- Distribute: HQMF-wrapped, FHIR ValueSet–referenced packages with human-readable specs for governance review.
- Execute: Dashboards update continuously; alerts auto-trigger patient outreach; leaders see status by patient, provider, location, and organization.
- Improve: FillMeIn graphs performance and cohorts; DataChaser campaigns close care gaps quickly with traceable outcomes.

Customer outcomes

- Faster closure of surveillance gaps via automated outreach and supervisor-aware escalation.
- Consistent, standards-based reporting across sites and providers.
- Readiness for the end-of-March 2026 reporting cycle with an enterprise-grade framework grounded in CMS standards.

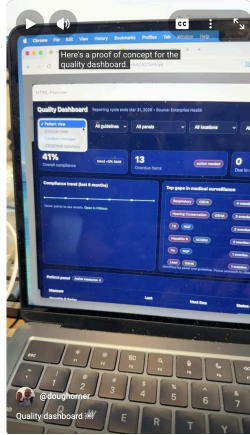

Availability and timeline

- Available today within EnterpriseHealth and WebChart EHR.
- Enterprise rollout and dashboard expansion aligned to the next reporting cycle ending March 31, 2026.
- The OSHA Surveillance Quality Library is open and extensible to encourage broad adoption in occupational and clinical settings.

About Medical Informatics Engineering Medical Informatics Engineering, Inc. (MIE) builds interoperable health information solutions including WebChart EHR and EnterpriseHealth, enabling providers and employer health programs to deliver high-quality care, meet regulatory expectations, and improve outcomes at scale.
